

Chi Lin Kuo (Charlie)

Blockchain & Full-stack Developer

✉ charlie011111@gmail.com <https://kcl1104.github.io/> <https://www.linkedin.com/in/chi-lin-kuo-a47608209/>
<https://github.com/KCL1104/>

Summary

Computer Science graduate and AI-native full-stack engineer focused on building development workflows centered around AI coding agents. Capable of reliably shipping backend and full-stack products in fast-iteration environments.

- **Power user of AI development tools:** Use Claude Code and similar agents as my primary development partner on a daily basis. Significantly accelerate the cycle from requirements to deployment through prompt engineering and agent harness design.
- **Custom AI toolchain builder:** Proactively build MCP servers, agent skills, and automation scripts (e.g., issue triage, code review, commit message standardization), and integrate them into team production workflows.
- **Hackathon winner:** Encode Solana Hackathon — Cypherpunk side track (hosted by Sanctum) — AI Financial Innovation Hackathon winner.
- **Tech stack:** Node.js / NestJS, Next.js / React, TypeScript, Python, FastAPI, AI agents, PostgreSQL / Supabase, Solana / Anchor, Docker, CI/CD.

EMPLOYMENT HISTORY

Jepun International Backend & Blockchain Engineer 09/2025 - 03/2026

Owned several services / modules within a mid-sized product line (3–5 person cross-functional team).

- **Backend service development:** Designed and implemented RESTful APIs using Python (FastAPI / Django) and Node.js / Express, including corresponding database schema design (PostgreSQL, MongoDB, Supabase).
- **Third-party integrations:** Integrated multiple third-party APIs and SaaS services, handling cross-system data synchronization and error handling.
- **AI / LLM feature integration:** Led development of LLM-based features in the product, covering agent flow design and prompt tuning.
- **Frontend development:** Built corresponding frontend interfaces using React / Next.js, ensuring consistent data contracts between frontend and backend.
- **DevOps:** Built and maintained CI/CD pipelines and containerized deployments, helping shorten delivery cycles.
- **Deep use of AI tooling:** Used Claude Code and other AI coding agents as the primary driver of daily development — collaborating across requirement breakdown, design, and implementation — systematically integrating agents into the development loop.

Star Vaults Backend Engineer 03/2026 - Present

Owned an entire service module end-to-end (e-commerce platform / internal tooling context).

- **Architecture & implementation:** Collaborated with 1–2 senior colleagues on architectural decisions, then led implementation, API design, data modeling, and deployment.
- **Backend development:** Node.js / NestJS, Python (FastAPI / Django), PostgreSQL, Supabase, Redis, MongoDB.
- **Frontend development:** Built corresponding frontend interfaces using React / Next.js, ensuring consistent data contracts between frontend and backend.
- **AI-driven development workflow:** Delegated boilerplate, unit tests, and repetitive code to Claude Code and other AI coding agents, allowing me to focus on architectural decisions, API boundary design, and business logic — substantially compressing delivery cycles.
- **Methodology contributions:** Built reusable prompt templates and agent skills, enabling agents to consistently follow team standards across commit messages, code reviews, and test writing.

Projects

PinTool Backend Engineer (Hackathon-winning / Team Project)

10/2025 - To Present

<https://demo.pintool.fun/>

- **Overview:** A Solana-native strategy automation platform where creators publish on-chain strategies and subscribers gain access through on-chain USDC subscriptions.
- **Tech stack:** NestJS, Supabase, Anchor (Solana), TypeScript
- **My responsibilities:**
 - Backend architecture design, API development, and subscription verification logic
 - Anchor smart contract integration and on-chain / off-chain state synchronization
 - Collab with front-end partner to ensure correct integration
- **Award:** Encode Solana Hackathon — Cypherpunk side track hosted by Sanctum — AI Financial Innovation Hackathon

LorePack Owner / Lead Developer (Personal Project)

02/2026 - 02/2026

<https://github.com/KCL1104/LorePack>

- **Overview:** An AI-driven collaborative storytelling platform where users build persistent worlds, generate illustrated chapters via AI agents, and collaborate across universes.
- **Tech stack:** Google ADK multi-agent orchestration framework, A2A protocol, Next.js, FastAPI
- **My responsibilities:**
 - Overall architecture and multi-agent collaboration flow design
 - A2A protocol integration and inter-agent messaging
 - Frontend interface development
- **Key learnings:** Hands-on implementation of multi-agent orchestration patterns, inter-agent task delegation, and result aggregation.

DeepFlow Owner / Lead Developer (Personal Project)

01/2026 - 01/2026

<https://github.com/KCL1104/DeepFlow>

- **Overview:** A personal project framed as an "intelligent defense system" — using context-aware scheduling and dynamic prioritization to filter out notification noise and protect deep work time.
- **Architecture layers:**
 - **Frontend:** Next.js (App Router) + Shadcn/UI, powering the "Focus Player" and queue visualization
 - **Backend:** Python FastAPI + Supabase + Redis, managing priority queues and receiving webhooks from multiple platforms (Slack / Jira / Gmail)
 - **Agent layer:** Python + LangChain, handling signal parsing, urgency scoring, and context-aware response generation
- **Technical highlights:** Implemented $O(\log N)$ dynamic priority queues using Redis Sorted Sets (ZSET); orchestrated LLM interactions with LangChain.
- **Key learnings:** A systematic exploration of engineering practices for AI agent applications — from webhook signal ingestion to agent reasoning flow design to three-tier service decomposition.
